Applicant : Stephen H. Hall

Serial No.: 10/015,712

Attorney's Docket No.: 10559-542001 / P12562

Intel Corporation

Filed: December 17, 2001,

Page : 2 of 8

## Amendments to the Specification:

Please amend the paragraph beginning at page 4, line 17 as follows:

--The bus 100 includes a series of transmission lines (also referred to microstrip lines)

102, 104 and 106 that pass over a slot 108 in a reference (ground or floating) plane 110. Slot 108 is terminated to reference plane 110 by short circuits 118 and 120. The transmission lines 102, 104 and 106 route signals, respectively, from processor 112, 114 and 116 to locations over the slot 108. In some implementations, transmission lines 102, 104, and 106 are terminated at reference plane 110 at points 122, 124, and 126, respectively. When properly excited, the slot 108 functions as a transmission line (referred to as a slotline), i.e., the slot 108 functions as a main bus trunk. The processors 112, 114 and 116, also referred to as agents, communicate with each other by transferring energy from a microstrip (or stripline) transmission mode, i.e., a mode in which signals can travel in the transmission lines, to a slotline transmission mode, i.e., a mode in which signals traveling in the slot 108, and vice versa.--
